

VOLUNITE

Technical User Interface Documentation

Functional overview based on annotated application screenshots

Document type: University technical report

System: Volunteer management and community platform

Prepared: July 2026

Student: _____

Course: _____

This document describes the principal user-facing functions visible in the captured frontend implementation.

1. Purpose and Scope

VolUnite is a web-based volunteer coordination platform that connects volunteers with organisations, activities and other community members. This report gives a concise functional description of the user interface shown in the annotated screenshots. It focuses on observable system behaviour rather than implementation details that cannot be confirmed visually.

System purpose

The platform supports the complete volunteer participation cycle: discovery, authentication, profile-based matching, activity registration, organisation membership, community communication, goal tracking and reporting.

Principal capabilities

1	Public organisation discovery and authenticated access.
2	Personalised dashboards and activity recommendations.
3	Organisation, project, activity and community-goal management.
4	Friendships, forums, direct chat and relationship graphs.
5	Volunteer profiles containing skills, interests and participation history.
6	Operational reporting through indicators, charts and capacity analysis.

Interface structure

Authenticated screens share a persistent header containing notification and session controls. A fixed bottom navigation bar links the primary modules: profile, community, home, organisations, activities and reports. Card-based layouts are used consistently to group related data and actions.

Evidence basis

The figures use representative demo data for the user Alice. Red numbered boxes identify the interface regions discussed directly below each image. The screenshots document the current frontend state as captured in July 2026.

2. Authentication and Public Discovery

The landing screen combines authentication with limited public discovery. A visitor can review organisations before signing in, while authenticated access is initiated through a conventional username and password workflow.

Figure 1. Login and public organisation discovery screen.

1	The page header communicates the current route and exposes the session action.
2	The authentication form provides username, password, password visibility, remember-me and recovery controls.
3	Organisation search and filtering are available without authentication.
4	Organisation cards present the name, short purpose and thematic tags.

3. Personalised Home Dashboard

After authentication, the application presents a personalised operational summary. The dashboard prioritises recent participation and recommends new opportunities using the user's existing profile and activity history.

Figure 2. Authenticated home dashboard for the demo user Alice.

1	The user summary displays identity, membership date and totals for friends, organisations and activities.
2	Recent highlights show the latest joined activity, organisation and friend.
3	Recommended activity cards expose date, location, tags, skills, capacity and a direct join action.
4	A persistent bottom navigation bar provides access to the main application modules.

4. Organisation Management

Organisation pages consolidate descriptive, geographic and operational data. They connect community goals with concrete projects, activities and membership information, allowing volunteers to evaluate and join an organisation.

Figure 3. Organisation detail page with operational and social information.

1	The organisation identity block includes its description, creation date, location and join action.
2	A map visualises the organisation's geographic context.
3	Community goals show measurable progress and provide create, overview and edit actions.
4	Projects are presented with status information.
5	Activities expose schedule, capacity and participant information.
6	Membership sections distinguish friends in the organisation from the complete member list.

5. Community and Collaboration

The community module extends the platform beyond activity registration. It combines social relationships, shared participation, forum discussions, direct conversations and graph-based exploration in one tabbed workspace.

Figure 4. Community screen showing friendships, shared activities and relationship analysis.

1	Top-level tabs separate friends, forum and chat functionality.
2	The friends list links to individual volunteer profiles.
3	Shared activity cards show where friends are participating.
4	Secondary tabs switch between relationship and activity graphs.
5	The relationship graph visualises the selected user's social network.
6	The main navigation remains available during community interaction.

6. Activity Discovery and Participation

Activity discovery is structured around user state. Joined activities are separated from recommendations and the complete catalogue, while search, filters, tags and capacity information support rapid comparison.

Figure 5. Activity catalogue with joined, recommended and complete result groups.

1	The overview displays total, joined and open activity counts.
2	Search and filter controls narrow the activity catalogue.
3	Joined activities provide a concise view of existing commitments.
4	Recommended activities support personalised discovery.
5	The complete catalogue presents all available opportunities with dates, tags and friend participation.
6	Navigation and the create action support movement between browsing and administration workflows.

7. Volunteer Profile

The profile functions as both an identity record and a participation portfolio. It combines contact information, skills and interests with the user's social connections and volunteering history.

Figure 6. Volunteer profile and participation history.

1	Profile identity and the edit action are displayed prominently.
2	Account details, skills and fields of interest support matching and recommendations.
3	Friends provide the social context of the volunteer.
4	Joined organisations show institutional participation.
5	Joined activities form a concise volunteering history.
6	The profile can be shared and remains connected to the primary navigation.

8. Reporting and Decision Support

The reporting module translates participation data into operational indicators. Filters and user selection support targeted analysis, while several chart types cover time, category, contribution and capacity perspectives.

Figure 7. Reports dashboard with operational and participation analytics.

1	Filters and the volunteer selector define the reporting scope.
2	Key indicators summarise total hours, activities, active volunteers and average occupancy.
3	The monthly trend chart shows activity volume over time.
4	Category distribution highlights the balance of focus areas.
5	Volunteer contribution compares participation between users.
6	Capacity demand and the summary row identify highly requested activities and occupancy levels.

9. Community Goals

Community goals connect individual activity participation to measurable organisation-level outcomes. Each goal records a target, current progress, thematic tags and the completed activities that contributed to it.

Figure 8. Community-goal progress and contribution overview.

1	The goals header provides direct access to goal creation.
2	Each goal exposes title, tags, progress, target values and editing.
3	Completed activity contributions can be expanded for traceability.
4	Multiple goals can be monitored concurrently.
5	The global navigation remains accessible from the goal workflow.

10. Technical Observations and Conclusion

Consistent interaction model

The application uses a consistent card-based visual language, common navigation and repeated search/filter patterns. This reduces the learning effort when users move between organisations, activities and community content.

Data-driven personalisation

User skills, interests, relationships and participation history influence the dashboard, recommendations and reporting views. This indicates that the user profile is a central data source for both discovery and analytics.

Integrated community model

Friends, forums, chat, relationship graphs and shared activities are integrated with the volunteering workflow instead of being isolated social features. This design supports retention and coordination around common causes.

Measurable organisational outcomes

Community goals and reports transform individual activity records into measurable progress, volunteer-hours, category distribution and capacity indicators. These views are useful for organisation administrators and project evaluation.

Current interface defects

The captured registration, project-detail and notifications routes show a collapsed route-container layout in which content is compressed into a narrow vertical column. The behaviour appears systematic across those pages and should be treated as a frontend layout defect rather than intended responsive behaviour.

Recommended technical priorities

1	Correct the route-container or component-host width rules on the affected pages.
2	Add automated visual regression tests for desktop and mobile breakpoints.
3	Verify that maps, graphs and charts provide accessible text alternatives.
4	Keep recommendation reasons and goal contributions traceable to their source data.
5	Apply consistent loading, empty and error states across all data-driven modules.

Conclusion

VolUnite presents a coherent volunteer-management concept that combines opportunity discovery, social participation and measurable impact. The strongest parts of the interface are its personalised

activity workflow, integrated community features and analytical reporting. Resolving the identified layout defects and strengthening visual accessibility would improve its readiness for production use.
